Why reduce pesticide

### Additional attention :

- It is the best to spray in the early morning and in the late evening when the sunshine is weaker, in case the nutrients should vaporize. When the plants lose the vigor because of the insects or freezing, dilute a great deal of liquid fertilizer to spray the exterior of the leaves to save them and make them re-grow again.
- When being diluted according to the instructions, it can be mixed with acid pesticide like the organic phosphor etc. which kill the insects; but use it as soon as possible after being mixed.
- Do not mix it with the alkalescency insecticide or antiseptic in case of killing the microorganism; the interval between using Yang Kang fertilizer and using antiseptic should be as long as possible.
- During the course of using, do not drip the water into the bottle, in case of metamorphosing. After using the fertilizer, make sure that the cover is closed firmly so that the quality of the lefts won't be affected.
- The product has a steady quality and should be stored in a shady and dry place where the temperature is between 0 C°- 40 C°. But if you store it for a long time, it will turn brown and there will be some deposit; please use it after shaking up and it won't affect the quality and the components.
- A much better effects or outcomes will be obtained if you use our liquid fertilizer and solid fertilizer together.
